-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1) Responsive to communication(s) filed on 29 October 2007.
 2a) This action is **FINAL**. 2b) This action is non-final.
 3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4) Claim(s) 11-18 is/are pending in the application.
 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
 5) Claim(s) _____ is/are allowed.
 6) Claim(s) 11-18 is/are rejected.
 7) Claim(s) _____ is/are objected to.
 8) Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9) The specification is objected to by the Examiner.
 10) The drawing(s) filed on 25 November 2003 is/are: a) accepted or b) objected to by the Examiner.
 Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
 Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
 11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
 a) All b) Some * c) None of:
 1. Certified copies of the priority documents have been received.
 2. Certified copies of the priority documents have been received in Application No. _____.
 3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Response to Amendment

This Examiner's correspondence is directed to address applicant's amendment dated 10/29/07. The rejections under Section 103 have not been overcome. Refer to the foregoing amendment for additional details concerning applicant's rebuttal arguments and remarks. Accordingly, the present claims are finally rejected over the same grounds of rejection as posited infra and for the reasons of record:

Claim Disposition

1. Claims 1-8 and 10 are now cancelled.
2. Claim 9 had been previously cancelled.
3. Claims 11-18 are pending.

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.
5. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:
 1. Determining the scope and contents of the prior art.
 2. Ascertaining the differences between the prior art and the claims at issue.
 3. Resolving the level of ordinary skill in the pertinent art.

Art Unit: 1795

4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
6. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

7. Claims 11 and 17-8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kohno et al 6130006 view of Noda et al 5527639.

The present application is geared toward a nickel-hydrogen secondary battery wherein the disclosed inventive concept comprises the specific hydrogen-absorbing alloy.

As to claim 11:

Kohno et al disclose illustrate in Figure 2 a battery comprising a case 1, a positive electrode 2, a negative electrode 4, and a separator 3, and alkaline electrolyte (COL 32, line 14 to COL 33, line 60/ FIGURE 2).

Kohno et al's positive electrode includes a nickel hydroxide powder; and may also contain at least one oxide or hydroxide of metal selected from the group consisting of zinc and cobalt (COL 32, lines 49-62).

Kohno et al's negative electrode includes a hydrogen absorbing alloy powder (COL 33, lines 5-10). Table 7 below shows examples hydrogen absorbing alloy compositions comprising

Art Unit: 1795

Mg, at least La, at least Co, Al, and nickel. Thus, Kohno et al directly exemplified and show with sufficient specificity the hydrogen absorbing alloy composition claimed by the applicant.

TABLE 7

| Compositions | 40 |
|---|----|
| Example 45 $Mg_{0.31}La_{0.69}(Ni_{0.8}Co_{0.1}Al_{0.1})_{3.2}$ | |
| Example 46 $Mg_{0.3}La_{0.5}Pr_{0.2}(Ni_{0.8}Mn_{0.15}Si_{0.05})_{3.4}$ | |
| Example 47 $Mg_{0.27}La_{0.53}Nd_{0.2}(Ni_{0.8}Mn_{0.1}Co_{0.1})_{3.05}$ | |
| Example 48 $Mg_{0.25}La_{0.75}(Ni_{0.85}Co_{0.1}Fe_{0.05})_{3.7}$ | |
| Example 49 $Mg_{0.24}La_{0.76}(Ni_{0.8}Mn_{0.15}Ga_{0.05})_{3.65}$ | 45 |
| Example 50 $Mg_{0.34}La_{0.66}(Ni_{0.75}Co_{0.1}Mn_{0.1}Al_{0.05})_{3.33}$ | |
| Example 51 $Mg_{0.25}La_{0.45}Pr_{0.3}(Ni_{0.68}Co_{0.2}Cu_{0.1}Zn_{0.02})_{3.5}$ | |
| Example 52 $Mg_{0.28}La_{0.62}Nd_{0.1}(Ni_{0.84}Cu_{0.1}Sn_{0.05}B_{0.01})_{3.3}$ | |

As to claim 17:

Kohno et al's positive electrode may also contain at least one oxide or hydroxide of metal selected from the group consisting of zinc and cobalt (COL 32, lines 49-62).

As to claim 18:

Kohno et al's negative electrode is a hydrogen absorbing alloy powder (COL 33, lines 5-10) and may further include La, Ce, Pr, Nd and Y (COL 11, lines 45-55). Examples 45-47 illustrates the inclusion of Co and Al as well (See EXAMPLES 45-47).

Example 45 $Mg_{0.31}La_{0.69}(Ni_{0.8}Co_{0.1}Al_{0.1})_{3.2}$
 Example 46 $Mg_{0.3}La_{0.5}Pr_{0.2}(Ni_{0.8}Mn_{0.15}Si_{0.05})_{3.4}$
 Example 47 $Mg_{0.27}La_{0.53}Nd_{0.2}(Ni_{0.8}Mn_{0.1}Co_{0.1})_{3.05}$

Example 57 $La_{0.57}Pr_{0.17}Mg_{0.25}Ti_{0.01}(Ni_{0.92}Co_{0.05}Mn_{0.02}Al_{0.01})_{3.54}$

Example 82 $La_{0.63}Nd_{0.1}Mg_{0.27}(Ni_{0.85}Co_{0.1}Cr_{0.03}Fe_{0.02})_{3.7}$

Kohno et al disclose a nickel-hydrogen secondary battery according to the aforementioned aspects. However, Kohno et al do not expressly disclose the specific additional element/compound of positive electrode.

As to claim 11:

Noda et al disclose a galvanic cell (TITLE/ABSTRACT) such as nickel-hydrogen cell (COL 5, lines 4-6) wherein the positive electrode active material includes Nb₂O₅, and/or WO₃ (COL 5, lines 16-32).

In view of the above, it would have been obvious to a person possessing a level of ordinary skill in the art at the time the invention was made to use the specific additional element/compound of positive electrode of Noda et al in the positive electrode of Kohno et al as it is well known in the art positive electrodes having such specific additional element are excellent in utilization factor of nickel hydroxide under atmosphere ranging from an ordinary temperature to a high temperature. Thus, such an additional element positively affects the charging characteristic of the electrode, particularly at a high temperature. *Furthermore, it is known in the art that incorporation of the foregoing additional element/compound in the positive electrode makes it possible to lower the rate at which the cobalt compound in the nickel hydroxide active material is dissolved and precipitated in the electrolytic solution. As a result, the overall structure of the positive electrode is rendered denser, thereby preventing other metals such as Mn, Al, Ca and Mg constituting the hydrogen-absorbing alloy which have been eluted with the electrolytic solution after prolonged storage from penetrating into the positive electrode, making it possible to maintain a good conduction network.*

Art Unit: 1795

8. Claims 11 and 17-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kohno et al 6130006 view of Fleischer et al 2002/0122980.

As to claim 11:

Kohno et al disclose illustrate in Figure 2 a battery comprising a case 1, a positive electrode 2, a negative electrode 4, and a separator 3, and alkaline electrolyte (COL 32, line 14 to COL 33, line 60/ FIGURE 2).

Kohno et al's positive electrode includes a nickel hydroxide powder; and may also contain at least one oxide or hydroxide of metal selected from the group consisting of zinc and cobalt (COL 32, lines 49-62).

Kohno et al's negative electrode includes a hydrogen absorbing alloy powder (COL 33, lines 5-10). **Table 7** below shows examples hydrogen absorbing alloy compositions comprising Mg, at least La, at least Co, Al, and nickel. *Thus, Kohno et al directly exemplified and show with sufficient specificity the hydrogen absorbing alloy composition claimed by the applicant.*

TABLE 7

| | Compositions | 40 |
|------------|---|----|
| Example 45 | Mg _{0.31} La _{0.69} (Ni _{0.8} Co _{0.1} Al _{0.1}) _{3.2} | |
| Example 46 | Mg _{0.3} La _{0.5} Pr _{0.2} (Ni _{0.8} Mn _{0.15} Si _{0.05}) _{3.4} | |
| Example 47 | Mg _{0.27} La _{0.53} Nd _{0.2} (Ni _{0.8} Mn _{0.1} Co _{0.1}) _{3.08} | |
| Example 48 | Mg _{0.25} Lm _{0.75} (Ni _{0.85} Co _{0.1} Fe _{0.05}) _{3.7} | |
| Example 49 | Mg _{0.24} Lm _{0.76} (Ni _{0.8} Mn _{0.15} Ga _{0.05}) _{3.65} | 45 |
| Example 50 | Mg _{0.34} Lm _{0.66} (Ni _{0.75} Co _{0.1} Mn _{0.1} Al _{0.05}) _{3.33} | |
| Example 51 | Mg _{0.25} Lm _{0.45} Pr _{0.3} (Ni _{0.68} Co _{0.2} Cu _{0.1} Zn _{0.02}) _{3.5} | |
| Example 52 | Mg _{0.28} Lm _{0.62} Nd _{0.1} (Ni _{0.84} Cu _{0.1} Sn _{0.05} B _{0.01}) _{3.3} | |

As to claim 17:

Kohno et al's positive electrode may also contain at least one oxide or hydroxide of metal selected from the group consisting of zinc and cobalt (COL 32, lines 49-62).

As to claim 18:

Kohno et al's negative electrode is a hydrogen absorbing alloy powder (COL 33, lines 5-10) and may further include La, Ce, Pr, Nd and Y (COL 11, lines 45-55). Examples 45-47 illustrates the inclusion of Co and Al as well (See EXAMPLES 45-47).

Example 45 $Mg_{0.31}La_{0.69}(Ni_{0.8}Co_{0.1}Al_{0.1})_{3.2}$
Example 46 $Mg_{0.3}La_{0.5}Pr_{0.2}(Ni_{0.8}Mn_{0.15}Si_{0.05})_{3.4}$
Example 47 $Mg_{0.27}La_{0.53}Nd_{0.2}(Ni_{0.8}Mn_{0.1}Co_{0.1})_{3.05}$

Example 57 $La_{0.57}Pr_{0.17}Mg_{0.25}Ti_{0.01}(Ni_{0.92}Co_{0.05}Mn_{0.02}Al_{0.01})_{3.54}$

Example 82 $La_{0.63}Nd_{0.1}Mg_{0.27}(Ni_{0.85}Co_{0.1}Cr_{0.03}Fe_{0.02})_{3.7}$

Kohno et al disclose a nickel-hydrogen secondary battery according to the aforementioned aspects. However, Kohno et al do not expressly disclose the specific additional element/compound of positive electrode.

As to claim 11:

Fleischer et al disclose electrochemical cells (TITLE/ABSTRACT) such as nickel/metal hydride using a hydrogen storage alloy (P0020 & 0006) wherein the cathode may be made from one or more of a number of materials including nickel hydroxides, and WO_3 and/or MO_2 , where M is Nb, among others (P0058).

In view of the above, it would have been obvious to a person possessing a level of ordinary skill in the art at the time the invention was made to use the specific additional element/compound of positive electrode of Fleischer et al in the positive electrode of Kohno et al as Fleischer et al disclose that it is known to make cathode comprising one or more of the above-mentioned compounds for the purposes of increasing capacity and open circuit voltage, and electrochemical stability. Additionally, it is well-known in the art that positive electrodes having such specific additional element are excellent in utilization factor of nickel hydroxide under

atmosphere ranging from an ordinary temperature to a high temperature. Thus, such an additional element positively affects the charging characteristic of the electrode, particularly at a high temperature. *Furthermore, it is known in the art that incorporation of the foregoing additional element/compound in the positive electrode makes it possible to lower the rate at which the cobalt compound in the nickel hydroxide active material is dissolved and precipitated in the electrolytic solution. As a result, the overall structure of the positive electrode is rendered denser, thereby preventing other metals such as Mn, Al, Ca and Mg constituting the hydrogen-absorbing alloy which have been eluted with the electrolytic solution after prolonged storage from penetrating into the positive electrode, making it possible to maintain a good conduction network.*

9. Claims 11 and 17-8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kohno et al 6130006 view of Imoto et al 2003/0096166.

The present application is geared toward a nickel-hydrogen secondary battery wherein the disclosed inventive concept comprises the specific hydrogen-absorbing alloy.

As to claim 11:

Kohno et al disclose illustrate in Figure 2 a battery comprising a case 1, a positive electrode 2, a negative electrode 4, and a separator 3, and alkaline electrolyte (COL 32, line 14 to COL 33, line 60/ FIGURE 2).

Kohno et al's positive electrode includes a nickel hydroxide powder; and may also contain at least one oxide or hydroxide of metal selected from the group consisting of zinc and cobalt (COL 32, lines 49-62).

Kohno et al's negative electrode includes a hydrogen absorbing alloy powder (COL 33, lines 5-10). Table 7 below shows examples hydrogen absorbing alloy compositions comprising Mg, at least La, at least Co, Al, and nickel. *Thus, Kohno et al directly exemplified and show with sufficient specificity the hydrogen absorbing alloy composition claimed by the applicant.*

TABLE 7

| Compositions | 40 |
|---|----|
| Example 45 $Mg_{0.31}La_{0.69}(Ni_{0.8}Co_{0.1}Al_{0.1})_{3.2}$ | |
| Example 46 $Mg_{0.3}La_{0.5}Pr_{0.2}(Ni_{0.8}Mn_{0.15}Si_{0.05})_{3.4}$ | |
| Example 47 $Mg_{0.27}La_{0.53}Nd_{0.2}(Ni_{0.8}Mn_{0.1}Co_{0.1})_{3.05}$ | |
| Example 48 $Mg_{0.25}La_{0.75}(Ni_{0.85}Co_{0.1}Fe_{0.05})_{3.7}$ | |
| Example 49 $Mg_{0.24}La_{0.76}(Ni_{0.8}Mn_{0.15}Ga_{0.05})_{3.65}$ | 45 |
| Example 50 $Mg_{0.34}La_{0.66}(Ni_{0.75}Co_{0.1}Mn_{0.1}Al_{0.05})_{3.33}$ | |
| Example 51 $Mg_{0.25}La_{0.45}Pr_{0.3}(Ni_{0.68}Co_{0.2}Cu_{0.1}Zn_{0.02})_{3.5}$ | |
| Example 52 $Mg_{0.28}La_{0.62}Nd_{0.1}(Ni_{0.84}Cu_{0.1}Sn_{0.05}B_{0.01})_{3.3}$ | |

As to claim 17:

Kohno et al's positive electrode may also contain at least one oxide or hydroxide of metal selected from the group consisting of zinc and cobalt (COL 32, lines 49-62).

As to claim 18:

Kohno et al's negative electrode is a hydrogen absorbing alloy powder (COL 33, lines 5-10) and may further include La, Ce, Pr, Nd and Y (COL 11, lines 45-55). Examples 45-47 illustrates the inclusion of Co and Al as well (See EXAMPLES 45-47).

| | |
|------------|---|
| Example 45 | $Mg_{0.31}La_{0.69}(Ni_{0.8}Co_{0.1}Al_{0.1})_{3.2}$ |
| Example 46 | $Mg_{0.3}La_{0.5}Pr_{0.2}(Ni_{0.8}Mn_{0.15}Si_{0.05})_{3.4}$ |
| Example 47 | $Mg_{0.27}La_{0.53}Nd_{0.2}(Ni_{0.8}Mn_{0.1}Co_{0.1})_{3.05}$ |
| Example 57 | $La_{0.57}Pr_{0.17}Mg_{0.25}Ti_{0.01}(Ni_{0.92}Co_{0.05}Mn_{0.02}Al_{0.01})_{3.54}$ |
| Example 82 | $La_{0.63}Nd_{0.1}Mg_{0.27}(Ni_{0.85}Co_{0.1}Cr_{0.03}Fe_{0.02})_{3.7}$ |

Kohno et al disclose a nickel-hydrogen secondary battery according to the aforementioned aspects. However, Kohno et al do not expressly disclose the specific additional element/compound of positive electrode.

As to claim 11:

Imoto et al disclose Nickel-Hydrogen storage batteries (TITLE/ABSTRACT/P0009, 0036, 0053) comprising a hydrogen absorbing alloy as the negative electrode (P0011) and nickel hydroxide as the positive electrode (P0015) wherein the positive electrode further comprises incorporated amounts of Nb and W compounds such as Nb₂O₅ (P0015-0016, 0012, 0023-0024, 0044-0046) and/or WO₃ and/or WO₂ (P0015-0016, 0012).

In view of the above, it would have been obvious to a person possessing a level of ordinary skill in the art at the time the invention was made to use the specific additional element/compound of positive electrode of Imoto et al in the positive electrode of Kohno et al as Imoto et al disclose that the incorporation of the foregoing additional element/compound in the positive electrode makes it possible to lower the rate at which the cobalt compound in the nickel hydroxide active material is dissolved and precipitated in the electrolytic solution. As a result, the overall structure of the positive electrode is rendered denser, thereby preventing other metals such ad Mn, Al, Ca and Mg constituting the hydrogen-absorbing alloy which have been eluted with the electrolytic solution after prolonged storage from penetrating into the positive electrode, making it possible to maintain a good conduction network.

Art Unit: 1795

10. Claims 11 and 17-8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kohno et al 6130006 view of Sato et al 2004/0234865.

The present application is geared toward a nickel-hydrogen secondary battery wherein the disclosed inventive concept comprises the specific hydrogen-absorbing alloy.

As to claim 11:

Kohno et al disclose illustrate in Figure 2 a battery comprising a case 1, a positive electrode 2, a negative electrode 4, and a separator 3, and alkaline electrolyte (COL 32, line 14 to COL 33, line 60/ FIGURE 2).

Kohno et al's positive electrode includes a nickel hydroxide powder; and may also contain at least one oxide or hydroxide of metal selected from the group consisting of zinc and cobalt (COL 32, lines 49-62).

Kohno et al's negative electrode includes a hydrogen absorbing alloy powder (COL 33, lines 5-10). Table 7 below shows examples hydrogen absorbing alloy compositions comprising Mg, at least La, at least Co, Al, and nickel. *Thus, Kohno et al directly exemplified and show with sufficient specificity the hydrogen absorbing alloy composition claimed by the applicant.*

TABLE 7

| | Compositions | 40 |
|------------|---|----|
| Example 45 | Mg _{0.31} La _{0.69} (Ni _{0.8} Co _{0.1} Al _{0.1}) _{3.2} | |
| Example 46 | Mg _{0.3} La _{0.5} Pt _{0.2} (Ni _{0.8} Mn _{0.15} Si _{0.05}) _{3.4} | |
| Example 47 | Mg _{0.27} La _{0.53} Nd _{0.2} (Ni _{0.8} Mn _{0.1} Co _{0.1}) _{3.05} | |
| Example 48 | Mg _{0.25} Lm _{0.75} (Ni _{0.85} Co _{0.1} Fe _{0.05}) _{3.7} | |
| Example 49 | Mg _{0.24} Lm _{0.76} (Ni _{0.8} Mn _{0.15} Ga _{0.05}) _{3.65} | 45 |
| Example 50 | Mg _{0.34} Lm _{0.66} (Ni _{0.75} Co _{0.1} Mn _{0.1} Al _{0.05}) _{3.33} | |
| Example 51 | Mg _{0.25} Lm _{0.45} Pt _{0.3} (Ni _{0.68} Co _{0.2} Cu _{0.1} Zn _{0.02}) _{3.5} | |
| Example 52 | Mg _{0.28} Lm _{0.62} Nd _{0.1} (Ni _{0.84} Cu _{0.1} Sn _{0.05} B _{0.01}) _{3.3} | |

As to claim 17:

Kohno et al's positive electrode may also contain at least one oxide or hydroxide of metal selected from the group consisting of zinc and cobalt (COL 32, lines 49-62).

Art Unit: 1795

As to claim 18:

Kohno et al's negative electrode is a hydrogen absorbing alloy powder (COL 33, lines 5-10) and may further include La, Ce, Pr, Nd and Y (COL 11, lines 45-55). Examples 45-47 illustrates the inclusion of Co and Al as well (See EXAMPLES 45-47).

Example 45

Example 46

Example 47

Example 57 $\text{La}_{0.57}\text{Pr}_{0.17}\text{Mg}_{0.25}\text{Ti}_{0.01}(\text{Ni}_{0.92}\text{Co}_{0.05}\text{Mn}_{0.02}\text{Al}_{0.01})_{3.54}$

Example 82 $\text{La}_{0.63}\text{Nd}_{0.1}\text{Mg}_{0.27}(\text{Ni}_{0.85}\text{Co}_{0.1}\text{Cr}_{0.03}\text{Fe}_{0.02})_{3.7}$

Kohno et al disclose a nickel-hydrogen secondary battery according to the aforementioned aspects. However, Kohno et al do not expressly disclose the specific additional element/compound of positive electrode.

As to claim 11:

Sato et al disclose batteries such as nickel hydrogen cells which employ aqueous electrolytes (P0003, 0012) wherein the positive electrode active material is selected as appropriate for the type of battery and other consideration and includes Nb_2O_5 and/or WO_3 (P0209).

In view of the above, it would have been obvious to a person possessing a level of ordinary skill in the art at the time the invention was made to use the specific additional element/compound of positive electrode of Sato et al in the positive electrode of Kohno et al as Sato et al discloses that the foregoing element/compounds are suitable positive electrode active materials and can be selected as appropriate for the type of battery and other considerations. Thus, Sato et al disclose the suitability of employing the specifically claimed additional

element/compound in the positive electrode. Imperative to note is that is well-known in the art that positive electrodes having such specific additional element are excellent in utilization factor of nickel hydroxide under atmosphere ranging from an ordinary temperature to a high temperature. Thus, such an additional element positively affects the charging characteristic of the electrode, particularly at a high temperature. *Furthermore, it is known in the art that incorporation of the foregoing additional element/compound in the positive electrode makes it possible to lower the rate at which the cobalt compound in the nickel hydroxide active material is dissolved and precipitated in the electrolytic solution. As a result, the overall structure of the positive electrode is rendered denser, thereby preventing other metals such ad Mn, Al, Ca and Mg constituting the hydrogen-absorbing alloy which have been eluted with the electrolytic solution after prolonged storage from penetrating into the positive electrode, making it possible to maintain a good conduction network.*

11. Claims 11 and 17-8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kohno et al 6130006 view of Shinyama et al 2005/0019657.

The present application is geared toward a nickel-hydrogen secondary battery wherein the disclosed inventive concept comprises the specific hydrogen-absorbing alloy.

As to claim 11:

Kohno et al disclose illustrate in Figure 2 a battery comprising a case 1, a positive electrode 2, a negative electrode 4, and a separator 3, and alkaline electrolyte (COL 32, line 14 to COL 33, line 60/ FIGURE 2).

Kohno et al's positive electrode includes a nickel hydroxide powder; and may also contain at least one oxide or hydroxide of metal selected from the group consisting of zinc and cobalt (COL 32, lines 49-62).

Kohno et al's negative electrode includes a hydrogen absorbing alloy powder (COL 33, lines 5-10). **Table 7** below shows examples hydrogen absorbing alloy compositions comprising Mg, at least La, at least Co, Al, and nickel. *Thus, Kohno et al directly exemplified and show with sufficient specificity the hydrogen absorbing alloy composition claimed by the applicant.*

TABLE 7

| Compositions | 40 |
|---|----|
| Example 45 $Mg_{0.31}La_{0.69}(Ni_{0.8}Co_{0.1}Al_{0.1})_{3.2}$ | |
| Example 46 $Mg_{0.3}La_{0.5}Pr_{0.2}(Ni_{0.8}Mn_{0.15}Si_{0.05})_{3.4}$ | |
| Example 47 $Mg_{0.27}La_{0.53}Nd_{0.2}(Ni_{0.8}Mn_{0.1}Co_{0.1})_{3.05}$ | |
| Example 48 $Mg_{0.25}Lm_{0.75}(Ni_{0.85}Co_{0.1}Fe_{0.05})_{3.7}$ | |
| Example 49 $Mg_{0.24}Lm_{0.76}(Ni_{0.8}Mn_{0.15}Ga_{0.05})_{3.65}$ | 45 |
| Example 50 $Mg_{0.34}Lm_{0.66}(Ni_{0.75}Co_{0.1}Mn_{0.1}Al_{0.05})_{3.33}$ | |
| Example 51 $Mg_{0.25}Lm_{0.45}Pr_{0.3}(Ni_{0.68}Co_{0.2}Cu_{0.1}Zn_{0.02})_{3.5}$ | |
| Example 52 $Mg_{0.28}Lm_{0.62}Nd_{0.1}(Ni_{0.84}Cu_{0.1}Sn_{0.05}B_{0.01})_{3.3}$ | |

As to claim 17:

Kohno et al's positive electrode may also contain at least one oxide or hydroxide of metal selected from the group consisting of zinc and cobalt (COL 32, lines 49-62).

As to claim 18:

Kohno et al's negative electrode is a hydrogen absorbing alloy powder (COL 33, lines 5-10) and may further include La, Ce, Pr, Nd and Y (COL 11, lines 45-55). Examples 45-47 illustrates the inclusion of Co and Al as well (See EXAMPLES 45-47).

| | |
|------------|---|
| Example 45 | $Mg_{0.31}La_{0.69}(Ni_{0.8}Co_{0.1}Al_{0.1})_{3.2}$ |
| Example 46 | $Mg_{0.3}La_{0.5}Pr_{0.2}(Ni_{0.8}Mn_{0.15}Si_{0.05})_{3.4}$ |
| Example 47 | $Mg_{0.27}La_{0.53}Nd_{0.2}(Ni_{0.8}Mn_{0.1}Co_{0.1})_{3.05}$ |
| Example 57 | $La_{0.57}Pr_{0.17}Mg_{0.25}Ti_{0.01}(Ni_{0.92}Co_{0.05}Mn_{0.02}Al_{0.01})_{3.54}$ |
| Example 82 | $La_{0.63}Nd_{0.1}Mg_{0.27}(Ni_{0.85}Co_{0.1}Cr_{0.03}Fe_{0.02})_{3.7}$ |

Kohno et al disclose a nickel-hydrogen secondary battery according to the aforementioned aspects. However, Kohno et al do not expressly disclose the specific additional element/compound of positive electrode.

As to claim 11:

Shinyama et al disclose Ni-based batteries using nickel hydroxide as the positive electrode, a hydrogen absorbing alloy as the negative electrode, and an alkaline electrolyte solution (ABSTRACT/P0002, 0019, 0022, 0038) wherein WO_3 is added to an electrode (P0068, 0092-0093, 0096, 0099).

In view of the above, it would have been obvious to a person possessing a level of ordinary skill in the art at the time the invention was made to use the specific additional element/compound of positive electrode of Shinyama et al in the positive electrode of Kohno et al as Shinyama et al discloses that the addition of W or W-based compound to the electrode prevents oxidation and degradation of the electrode material, and storage characteristics of the nickel-based battery are extremely improved, and even in the storage under high temperature, decrease of capacity by self-discharge is declined, and cycle characteristics of the nickel-based battery are improved. *Thus, the teachings of Shinyama et al apply with equal force to any electrode element regardless of its polarity.* Imperative to further note is that is well-known in the art that positive electrodes having such specific additional element are excellent in utilization factor of nickel hydroxide under atmosphere ranging from an ordinary temperature to a high temperature. Thus, such an additional element positively affects the charging characteristic of the electrode, particularly at a high temperature. *Furthermore, it is known in the art that incorporation of the foregoing additional element/compound in the positive electrode makes it*

possible to lower the rate at which the cobalt compound in the nickel hydroxide active material is dissolved and precipitated in the electrolytic solution. As a result, the overall structure of the positive electrode is rendered denser, thereby preventing other metals such as Mn, Al, Ca and Mg constituting the hydrogen-absorbing alloy which have been eluted with the electrolytic solution after prolonged storage from penetrating into the positive electrode, making it possible to maintain a good conduction network.

12. Claims 12-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over: a) Kohno et al 6130006 in view of Noda et al 5527639; and/or b) Kohno et al 6130006 in view of Fleischer et al 2002/0122980; and/or c) Kohno et al 6130006 in view of Imoto et al 2003/0096166; and/or d) Kohno et al 6130006 in view of Sato et al 2004/0234865; and/or f) Kohno et al 6130006 in view of Shinyama et al 2005/0019657 as applied to claims 1 and/or 11 above, and further in view of the Japanese publication JP 10-261412 (heretofore ‘the JP’412’).

The preceding prior art references are applied, argued and incorporated herein for the reasons manifested above.

As to claims 4-6 and 14-16:

Additionally, Kohno et al’s positive electrode includes a nickel hydroxide powder; and may also contain at least one oxide or hydroxide of metal selected from the group consisting of zinc and cobalt (COL 32, lines 49-62).

Kohno et al’s positive electrode includes a nickel hydroxide powder; and may also contain at least one oxide or hydroxide of metal selected from the group consisting of zinc and cobalt (COL 32, lines 49-62). Since Kohno et al disclose that conductive materials can be added

to the nickel hydroxide, it is contended that the average valency behavior (i.e. higher than 2) of the nickel contained in the nickel hydroxide is a inherent characteristic thereof first because of the addition of more conductive material, specifically Co, which tends to alter valency upon interaction with Ni, and second because during charging and discharging cycles the nickel hydroxide is compelled to take transitional states for electrochemical reaction purposes.

However, none of the preceding prior art references expressly disclose the specific Co-based coating and its specific high order-distorted crystal structure characteristics.

As to claims 2-3 and 12-13:

The JP'412 makes public that a positive nickel hydroxide positive electrode of an alkaline storage battery has a coating layer comprising a Co-based compound having a valence of more than 2 to cover the Ni-hydroxide particle, and a compound of at least one kind of element selected from a group consisting of at least Ca, Sr, Ba and Yb (ABSTRACT).

The JP'412 makes public that a positive nickel hydroxide positive electrode of an alkaline storage battery has a coating layer comprising a Co-based compound having a valence of more than 2 to cover the Ni-hydroxide particle (ABSTRACT).

In view of the above, it would have been obvious to a person possessing a level of ordinary skill in the art at the time the invention was made to use a cobalt compound coating on the nickel hydroxide of the positive electrode of the preceding prior art references as taught by the JP'412 because the JP'412 discloses that positive electrodes including such a coating material is excellent in utilization factor of nickel hydroxide under atmosphere ranging from an ordinary temperature to a high temperature. Thus, the cobalt-based layer on the Ni-hydroxide electrode material complements a better utilization of that electrode material.

Response to Arguments

13. Applicant's arguments filed 10/29/07 have been fully considered but they are not persuasive.

14. Applicant asserts that steps (1) to (3) are not PRESENT or DISCLOSED in the prior art. First of all, the examiner prefers to refer to them as features (1) to (3) because the present claims are directed to a product (i.e. a nickel-hydrogen secondary battery per se), not to a method or process including positive steps. Feature (1) calls for a specific additive contained in the positive electrode and its implied characteristic; feature (2) calls for a specific negative electrode composition comprising a hydrogen absorbing alloy and its implied characteristic; and feature (3) calls for at least one of WO₂ and WO₃ being selected as the additive.

That being said, let's see what the prior art teaches, with respect to features (1) and (3), all of the cited secondary references (i.e. Noda et al, Fleisher et al, Imoto et al, Sato et al and/or Shinyama et al) do disclose at least one of the following additive: WO₂ and/or WO₃. With respect to feature (2), primary reference Kohno et al'006 solidly teaches the specific composition of the negative electrode. This is supported by applicant's admission that "*Kohno et al disclose a battery including a negative electrode active material equivalent to the one used in the present invention*" (See paragraph bridging pages 8-9 of the 10/29/07 amendment).

Therefore, if all of the battery components and/or compositions are the SAME, then the combined battery of the prior art must necessarily behave in an identical manner to the one claimed by the applicant. Accordingly, products of identical chemical composition can not have mutually exclusive properties, and thus, all the specifically claimed properties are necessarily present in the prior art material.

"Products of identical chemical composition can not have mutually exclusive properties." A chemical composition and its properties are inseparable. Therefore, if the prior art teaches the identical chemical structure, the properties applicant discloses and/or claims are necessarily present. In re Spada, 911 F.2d 705, 709, 15 USPQ2d 1655, 1658 (Fed. Cir. 1990).

See MPEP 2112.01 [R-3] Composition, Product, and Apparatus Claims

- MPEP 2112.01 [R-3] Composition, Product, and Apparatus Claims:

I. PRODUCT AND APPARATUS CLAIMS — WHEN THE STRUCTURE RECITED IN THE REFERENCE IS SUBSTANTIALLY IDENTICAL TO THAT OF THE CLAIMS, CLAIMED PROPERTIES OR FUNCTIONS ARE PRESUMED TO BE INHERENT.

Where the claimed and prior art products are identical or substantially identical in structure or composition, or are produced by identical or substantially identical processes, a prima facie case of either anticipation or obviousness has been established. In re Best, 562 F.2d 1252, 1255, 195 USPQ 430, 433 (CCPA 1977). "When the PTO shows a sound basis for believing that the products of the applicant and the prior art are the same, the applicant has the burden of showing that they are not." In re Spada, 911 F.2d 705, 709, 15 USPQ2d 1655, 1658 (Fed. Cir. 1990).

Therefore, the examiner largely disagrees with applicant's unique assertion that "*the additives disclosed in either Noda et al, Fleisher et al, Imoto et al, Sato et al, or Shinyama et al clearly do not provide the advantage of the present invention or have any connection with the completion of the present invention.*" If applicant insists on this assertion by overlooking the above secondary references do disclose exactly the same additive in terms of composition, then

the Examiner requests to the Applicant to provide objective evidence demonstrating why the additives of the prior art do not or cannot exhibits the properties claimed by the applicant.

15. Concerning this matter, as taught in the prior art, WO_2 and/or WO_3 are familiar materials, compounds or substances in this art, both individually and in combination, and the combination of these familiar materials, compounds or substances with the electrode material and battery components of Kohno et al'006 according to known methods or techniques is likely to be obvious when it does no more than yield predictable results as here (i.e., an effective electrode material). *See KSR Int'l Co. v. Teleflex, Inc.*, 127 S. Ct. 1727, 1739 (U.S. 2007). The predictable result being the specific improvement in charging characteristic and efficiency of the electrode when these familiar materials are added.

In response to applicant's arguments that there is no specific suggestion or teaching in the references to combine prior art, the examiner responds that a decision of Supreme Court in *KSR International Co. v. Teflex Inc.*, 550 US, 82 USPQ2d 1385 (2007) forecloses the argument that a specific teaching, suggestion or motivation is required to support a finding of obviousness. See also recent Board decision *Ex Parte Smith*, USPQ2d, slip op. at 20 (Bd. Pat. App. & Interf. June 25, 2007) citing *KSR*, 82 USPQ2d at 1396. This applies to applicant's arguments implicitly contending that the teachings of Shinyama et al showing the addition of W or the like to the electrolyte or the negative electrode cannot be used in combination with the general teachings of Kohno et al. It also applies with equal force to all of the remaining 103 rejections (\leftarrow emphasis supplied).

16. Additionally, applicant's discussion of paragraph 0088-0089 and TABLE 1 of its published application'166 adds nothing to the patentability of the present claims because out of

the eleven (11) examples discussed therein, only EXAMPLE 9 uses at least one of the two claimed additives (i.e. WO₃). Moreover, all of the EXAMPLES 1-11 use negative electrode active materials more specific than the broadly claimed negative electrode material of claim 11. Thus, the content or importance of paragraph 0088-0089 and TABLE 1 applies only to those specific embodiments disclosed therein but cannot apply to applicant's invention as instantly claimed because they are not commensurate in scope therewith.

17. With respect to applicant's argument concerning the effective prior art date of Sato et al and Shinya et al, applicant cannot rely upon the foreign priority papers to overcome this rejection because a translation of said papers has not been made of record in accordance with 37 CFR 1.55. See MPEP § 201.15.

Conclusion

18. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

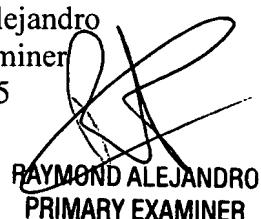

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Raymond Alejandro whose telephone number is (571) 272-1282. The examiner can normally be reached on Monday-Thursday (8:00 am - 6:30 pm).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Patrick J. Ryan can be reached on (571) 272-1292. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>.
